Why & What is Foundry

[Microsoft Foundry](#) | [Microsoft Azure](#)

Microsoft Foundry (formerly Azure AI Studio) unifies AI models, data, and developer tools into a single platform. Organizations use it **to build, scale, and govern production-ready AI applications and multi-agent workflows with enterprise security**. [\[1, 2, 3, 4\]](#)

Key Benefits

- **Massive Model Catalog:** Access thousands of foundational and frontier models from providers like OpenAI, Anthropic, Meta, and DeepSeek without model lock-in.
- **Unified Management:** Control models, custom tools, and knowledge grounding (via Foundry IQ) under one Azure resource and access plane.
- **Enterprise Governance:** Apply built-in Microsoft Entra security, role-based access control (RBAC), content filters, and safety guardrails.
- **Production Observability:** Trace, monitor, and evaluate agent performance and token costs through integrated operational dashboards.
- **Flexible Deployment:** Publish agents directly to Microsoft Teams, Microsoft 365 Copilot, or custom applications using unified APIs. [\[2, 5, 6\]](#)

If you want to explore further, tell me: Are you planning to build custom AI agents or deploy pre-trained models? Do you have specific **security or data privacy** needs?

[Microsoft Foundry documentation](#) | [Microsoft Learn](#)

[What is Microsoft Foundry? \(2 Minute overview\)](#)

PA_(MCP_AI_Microsoft_Foundry

To use the Microsoft Learn Model Context Protocol (MCP) server with an AI agent in Microsoft Foundry , **navigate to your project portal, create or open an agent, add a remote MCP tool from the catalog pointing to the Microsoft Learn endpoint, and configure specific behavioral instructions.** [1]

Setup Steps in the Portal

- Go to the Microsoft Foundry portal and open your project.
- Select **Build** and create or open your AI agent.
- Go to the **Tools** section and click **+ Add**.
- Choose **Remote MCP server** or look under the catalog options for Model Context Protocol.
- Select the unauthenticated **Microsoft Learn remote MCP server** option.
- Name your tool (e.g.,) and save the connection. [1, 2]

Agent Instructions & Execution

- Write system instructions telling the agent to rely strictly on the Microsoft Learn MCP tool for technical documentation rather than its static baseline training data.
- Save your configuration parameters.
- Test the agent in the playground; when prompted for permission to execute or call the external Microsoft Learn MCP tool, approve the request to fetch live documentation. [1, 3]

Would you like assistance configuring this via the Python SDK or setting up a **self-hosted custom MCP server** instead?

AI responses may include mistakes.
