
Modernizing Power Automate: From RPA & Flows to AI Agents

Day 1

Robotic Process Automation (RPA) vs Agentic AI Architecture

"Pure RPA" (Robotic Process Automation) refers to traditional, rule-based software robots that execute routine, repetitive digital tasks strictly using structured data and explicit logic, without the aid of artificial intelligence, machine learning, or cognitive decision-making.

- Why Microsoft Power Automate RPA Developer Training PL-500 is Retired

RPA taught computers to follow rules, while Agentic AI teaches computers to reason.

- Cloud Flows
- Desktop Flows
- Manual Configuration vs Agent Builds
- Old Way: The RPA Desktop Click-Bot (attended/unattended)

[Power Automate: Automation - Online Workshop - Training | Microsoft Learn](#) & Remote PC Labs

1. Install required software for Power Automate: Automation
2. Create your first desktop flow
3. Use input and output variables
4. Integrate with cloud flows

Day 2

Modern Automation (Build the automation)

1. AI Builder
2. Approvals
3. Outlook
4. Teams
5. Subflows

Day 3

[Course AB-410T00-A: Build intelligent applications - Training | Microsoft Learn](#) - w Skillable Labs

Intelligent Application Design

- New Way: The Copilot Studio AI Agent (Build the assistant)
- When should you use a Flow?
- When should you use an Agent?
- When should an Agent call a Flow?
- When should Desktop Automation still exist?

Build and scale intelligent apps, agents, and automation with an AI platform that maintains enterprise-grade control, security, and trust.

- Prompts
- Plans
- Dataverse
- Decision Framework
 - Flow vs Agent
 - Desktop Flow vs Agent Action

Day 4

Agent Architecture & Governance

- Dataverse
- Model-Driven App Lab
- Conversation Design
- Topics
- Knowledge Sources
- Actions
- Governance
- Security

Day 5

Capstone

1. Cloud Flow
2. Approval Flow
3. Grounded Prompts
4. Copilot Studio Agent
5. End-to-End Scenario
